

SCI-FI SPACE CRAFT

//// ////
SOUND
EFFECTS
LIBRARY

© Shapeforms.com

Thanks for purchasing **Sci-Fi Spacecraft**
and supporting independent audio!

**Effortlessly traverse land and space with over 900
futuristic vehicle sounds.**

Sci-Fi Spacecraft brings together over 200 hours of
sound design work into one easy to use and versatile
package, ready to bring sci-fi worlds to life!

I hope you enjoy the library!

Using the library

Sci-Fi Spacecraft is organised into folders of broadly related content, and named to highlight the sounds' main features to make it easier to browse through.

The sounds can be used for many other purposes than suggested by the filename, so feel free to experiment!

All sounds are normalized to roughly the same loudness.

Library format: 24-bit/48kHz wav

Metadata: Basic Soundminer, BWF

The categories

Air and Wind

A mix of one-shot and looping sounds for spacecraft flying through the air, air/gas leaks, propulsion, turbulence, atmospheric re-entry.

Ambience

A set of sounds for atmospheric ambience and spaceship interior scenes.

Boost

Sounds for boost and warp pads/gates, powerups and other rapid propulsion effects. Includes generic energy/electricity loops that can be used for energy recharge/drain/shield effects.

Engine Loops

The core of the library, these loops are designed to either work on their own or provide greater depth and variety when layered together.

Some sounds are designed specifically for layering, containing mostly low-, mid- or high-frequency audio content that combine to create a full-spectrum sound.

Loop lengths vary so that when layered the loop points don't align with one another adding to the realism of the overall sound.

The easiest way to utilise the sounds is to adjust their pitch according to the speed of the vehicle in-game (or in linear media).

An example setup might look like:

- **1 steady engine sound** that plays at full volume where the pitch increases with vehicle speed. At full speed the pitch might increase to +12 semitones.
- **1 engine strain sound** that fades in during acceleration, and out when cruising at a steady rate.
- **1 extra engine tone layer** that increases in volume as speed increases and is pitched up from 0 to 7 semitones between idle and max speed.

Because the base engine sound increases in pitch at a different rate to the secondary layer, the overall effect is of a very dynamic, interesting engine sound.

Layering just 3 sounds gives you 6,859,000 possible vehicle sound combinations!

Fly Bys

A selection of vehicle fly-bys from the **Sci-Fi Fly By** sound library, which was designed primarily for linear media (film, animation, cutscenes).

Sci-Fi Fly By features 480 additional fly-by sounds based on the engine loops in **Sci-Fi Spacecraft** (with some unique additional content) making it the perfect complement for use in linear/non-interactive productions: cutscenes, trailers, and short films.

Owners of **Sci-Fi Spacecraft** can purchase **Sci-Fi Fly By** at a discounted rate – a coupon code is included in the product folder.

If you do purchase **Sci-Fi Fly By**, the easiest way to ensure there are no duplicate files between the two libraries would be to delete the Fly Bys folder from **Sci-Fi Spacecraft**.

Impacts

A range of sounds for asteroid impacts and collisions with other vehicles or obstacles.

Takeoff & Landing

Sounds for vehicles taking off and landing. Includes one-shots and loops for descension/ascension.

Thrusters

Thruster flame ignition and sustained thruster loops.

Turbine

Engine turbines and mechanisms spinning up and down.

Mixing the sounds

If you'd like to push the sounds further back into the distance – perhaps you want them to sound as if they're emerging from another space or far away – you can either process the source audio files (as duplicate files) or apply audio effects in your game engine/video editing tool of choice.

There are a few ways to achieve this:

- **Lower the sample volume.** The easiest option of all is also one of the most effective.
- **Add a short fade-in** to the start of the audio file to reduce the initial transient of the sound, emulating what happens in real life as sound dissipates through air or bounced off walls and objects.
- **Apply reverb**, either algorithmic or convolution (from recordings of real-world spaces: rooms, halls, outdoor spaces and so on). Adjust the wet/dry ratio to match the space you want the sound to sit in, and how close it is to the 'camera' or listener's viewpoint.
- **Apply a low-pass filter (EQ)**, again either to the source file itself or in realtime using audio processing in a game engine or audio middleware such as Wwise or FMOD. Low-pass filters allow only the lower frequencies to be heard – removing high frequency details will make the sound appear to come from further away, or from behind a wall or obstacle. If you have any questions about how to process audio for a desired effect don't hesitate to get in touch – I'd love to help!

Updates and content requests

This library was made to help you accomplish your creative goals, so if there's anything I can add or improve upon to make it even more useful to you, please get in touch – I'll do my best to help!

Thank you!

It's with your support that I can continue to release Shapeforms Audio libraries and content updates. If you enjoy this library or any others, consider leaving a review, it really helps me out and I truly appreciate every one – thank you!

All the best,
Rich
