

GLITCH & NOISE

Thanks for purchasing **Glitch & Noise**
and supporting independent audio!

Glitch & Noise is a sound library containing 750 glitch and noise sound effects, from short and subtle to monstrous and mangled.

Wrenched from a variety of twisted sources including analogue tape decks, electromagnetic field recordings, modular synths, distressed data, radio noise, and even light itself, the library features a broad palette of grit, crunch, noise and stutter to bring games, video and music to life (or to total destruction!)

I hope you enjoy using the library!

Using the library

Glitch & Noise is organised into folders of broadly related content, and named to highlight the sounds' main features to make it a little easier to browse through.

The sounds can be used for many other purposes than suggested by the filename, so feel free to experiment!

All sounds are normalized to roughly the same loudness.

Many sounds contain a decent amount of high frequency content and can be slowed or pitched down for further sound design experimentation.

Try sequencing or layering multiple files together to generate new, more complex glitches.

Library format: 16-bit/44kHz wav

Metadata: Soundminer, BWF

The categories

8-Bit and Bitcrushed

Sounds that evoke the feeling of old videogame consoles and computer technology.

Broken Signals

Glitches and noise with occasional moments of silence, malfunctioning communications devices.

Cinematic Impacts

Large glitchy buildups and bassy impacts. Particularly useful for video edits or music production.

Crackle and Clicks

Sounds with a particularly crackly or clicky sound.

Digital

Glitches with a digital or synthetic sound to them.

Electrical

Sounds derived from actual electronics, effects designed to sound like arcing power.

EMF and Light

Sounds gathered by recording electromagnetic fields (EMF) and light itself interpreted as synthesized audio.

Feedback and Distortion

Grit and grunge galore.

Futuristic Interface

Glitches that evoke the feeling of an imagined malfunctioning futuristic interface or device.

Loops

A set of seamlessly looping noise and glitch textures.

Sequenced and Combined

A range of layered or sequenced glitches made with multiple sources.

Spectral

Glitchy effects with a glassy or watery tone, made with spectral processing.

Stutter and Stretch

Glitches featuring stuttered, stretched or rapidly repeated chunks of audio.

Tape

Noise from an old, failing tape cassette player and other tape-like effects.

Subtle

Glitches with only a limited range of frequency information, making them less full and heavy than others.

Transient and Taps

Extremely short transient effects – clicks, taps, pops and the like.

Transitions and Motion

Sounds that are ideal for various types of transition or that suggest motion, including risers to create tension.

Vocal

Glitches created from processing vocals and other synthesized vocal-like effects.

White Noise and Static

Noise derived from wireless headphones and other sources. Includes a few CRT TV inspired effects.

Mixing the sounds

If you'd like to push the sounds further back into the distance – perhaps you want them to sound as if they're emerging from another space or far away – you can either process the source audio files (as duplicate files) or apply audio effects in your game engine/video editing tool of choice.

There are a few ways to achieve this:

- **Lower the sample volume.** The easiest option of all is also one of the most effective.
- **Add a short fade-in** to the start of the audio file to reduce the initial transient of the sound, emulating what happens in real life as sound dissipates through air or bounced off walls and objects.
- **Apply reverb**, either algorithmic or convolution (from recordings of real-world spaces: rooms, halls, outdoor spaces and so on). Adjust the wet/dry ratio to match the space you want the sound to sit in, and how close it is to the 'camera' or listener's viewpoint.
- **Apply a low-pass filter (EQ)**, again either to the source file itself or in realtime using audio processing in a game engine or audio middleware such as Wwise or FMOD. Low-pass filters allow only the lower frequencies to be heard – removing high frequency details will make the sound appear to come from further away, or from behind a wall or obstacle. If you have any questions about how to process audio for a desired effect don't hesitate to get in touch – I'd love to help!

Updates and content requests

This library was made to help you accomplish your creative goals, so if there's anything I can add or improve upon to make it even more useful to you, please get in touch – I'll do my best to help!
